

AMBIENT ASSISTED LIVING

For you and people you care about

What is Ambient Assisted Living?

Ambient Assisted Living (AAL) is one of the major emerging technology markets of the moment, offering the potential to enable and empower citizens in their daily lives using state-of-the-art technologies. Known as 'assistive technologies' in some areas, AAL facilitates everyday activities for people who require care and support, augmenting their quality of life and assisting their independence.

Home of Technologies Ambient Assisted Living solution

Home of Technologies has developed a solution for a customer with disabilities and her carer/relative. Person living at home can control their lights, heating and blinds with one remote from everywhere in the house. The said remote also has an emergency button in case a day comes when urgent help is needed. When the button is pressed it automatically sends a message to predefined numbers or devices notifying that attention is required. In addition to the emergency button there are also motion sensors installed in the house and the carer/relative can monitor if their cared one is active and healthy. Necessary action can be taken if no activity is detected in the house for prolonged periods of time. It can be a lifesaving solution for the people you care about.
